

# Copper... *The Green Choice*

## *It's Old. It's New. It's Copper.*

At a time when renewable energy resources have never been more crucial, copper has long been a leader.

Copper has been used for more than 10,000 years and it's 100% recyclable. Now it is playing a leading role in one of Canada's most ambitious programs for renewable energy - wind turbine power generation. With the projected increase in wind farm installations nationwide over the next few years, the potential for wind power energy is dramatic - with the sky (or wind!) the limit.

Copper is the electrical conductor of choice to ensure the reliability and quality of the power generated from wind turbines. Contact us for more information on copper's role in renewable energy applications. The package includes "Connecting with Copper is Connecting with Trust", as well as information on electrical wire and cable seminars.
